Substitute Specification – PCT/EP03/01646 Attorney Docket: 095309.55319US

VEHICLE SEAT WITH BACK REST

[0001] This invention relates to a vehicle seat.

[0002] Such a vehicle seat is known from German publication DE 199 49

728 A1. The vehicle seat which is shown there is mounted displaceably in a

vehicle by means of rails. It has a backrest, which is guided in a sliding block

guide.

[0003] In modern vehicles, the construction space is often very limited. In

the rear, in particular, space is very cramped and is often additionally blocked by

installations and coverings and is inaccessible. Nevertheless, a vehicle seat must

be able to be connected rapidly and securely to the vehicle. For reasons of space

and/or time, known connecting methods, such as, for example, screwing the

backrest to a rear wall, are not economically feasible.

[0004] The object of the present invention is to provide a vehicle seat with

a backrest, which is of compact configuration and, at the same time, can be easily

and quickly fitted. In particular, the vehicle seat should be able to be securely

connected to the vehicle structure.

[0005] This object is achieved according to the invention.

[0006] The vehicle seat has a releasable locking mechanism, which is

configured for the securement of the backrest in a sliding block guide. The

locking mechanism can be operated, i.e. locked or unlocked, manually. If the

locking mechanism is unlocked, the backrest can be easily installed in a vehicle

and can be fastened there by operation of the locking mechanism. Simple

removal of the vehicle seat, e.g. for maintenance or repair works, is also possible.

For this, the locking mechanism of the backrest is released manually, whereupon

the seat, preferably the backrest, is easily removable from the vehicle.

[0007] In one embodiment, it is envisaged that the backrest is guided in a

sliding block guide, which is connected to the vehicle structure and has two

slideways. On each side of the backrest, a slideway is provided. The locking

mechanism of the backrest engages in the slideways with two bolts and in this

way connects the backrest to the vehicle structure. The backrest is thus on both

sides firmly and securely anchored and supported in the slideways by the bolts of

the locking mechanism and, at the same time, guided displaceably in the

slideways.

[8000] It is envisaged that the backrest, in one embodiment, has a tube

running transversely to the backrest and supporting the bolts of the locking

mechanism. The tube is preferably configured such that it passes right across the

width of the backrest and is connected to a bearing structure of the backrest,

preferably the frame of the backrest. The bolts of the locking mechanism can be

mounted in the tube in an axially displaceable manner.

[0009] By means of a draw band which cooperates with the bolts and is

manually operated, or a chain, the bolts can be axially displaced and hence

disengaged from the slideways in order to anchor the backrest in engagement

with the slideways and/or release the backrest.

[0010]In an advantageous embodiment, it is envisaged that the draw band

and/or the chain is configured to indicate the correct locking position of the

backrest. For this, the chain and/or the draw band can have a marking, which, in

the locked position of the bolts, coincides with a marking fixedly disposed on the

vehicle seat. If the vehicle seat or the backrest has not been properly locked, then

the bolts cannot be extended into their end position by means of the draw band

and/or the chain and the marking on the chain and/or the draw band fails to

coincide with the marking on the seat.

[0011] According to one embodiment, the marking on the draw band is

configured as a hook and/or eyelet and/or shackle. The marking fixedly disposed

on the vehicle seat is accordingly configured as a pin and/or hook, so that, if the

backrest is correctly locked, the draw band and/or the chain can be hung from

the seat, preferably can be fixed thereto, by joining up the markings.

[0012]It is possible to use the vehicle seat according to the invention in

passenger vehicles, buses and water craft or rail vehicles. Use of the vehicle seat

according to the invention as a comfortable passenger chair in aircraft is also

envisaged.

[0013]Further features and embodiments of the invention can be derived

from the claims, the figures and the description of the figures. The

aforementioned and below-stated features and combinations of features can be

used not only in the respectively indicated combination but also in isolation,

without departing from the scope of the invention.

[0014] Further embodiments of the invention are represented and explained in the drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

[0015] Figure 1 shows a vehicle seat with backrest and locking mechanism in schematic side view,

- [0016] Figure 2 shows a representation of the opened locking mechanism,
- [0017] Figure 3 shows a representation of the locked locking mechanism,
- [0018] Figure 4 shows a perspective representation of the locked locking mechanism,
- [0019] Figure 5 shows an enlarged representation of the bolt of the locking mechanism,
- [0020] Figure 6 shows a representation of the hanging of the draw band in the top of the vehicle seat, and
- [0021] Figure 7 shows a representation of the hanging of the draw band in the bottom of the vehicle seat.

DETAILED DESCRIPTION OF THE INVENTION

[0022] Figure 1 shows a vehicle seat 1 having a backrest 2 and a seat cushion 11. The vehicle seat 1 is mounted displaceably in a vehicle by means of rails 12. The contour of the padding of the backrest and seat cushion is indicated

with hatching. The backrest 2 has an upholstered backrest frame 21 and is

mounted displaceably in a sliding block guide 22, with slideways 23, which is

fastened in the vehicle. In addition, the backrest 2 is connected to the seat

cushion and the rails 12, e.g. hung or inserted, such that it is pivotable and

easily detachable.

[0023]Through displacement in the vehicle of the seat cushion 11, guided

displaceably in the rails 12, the backrest 2 hinge-connected to the seat cushion

11 is displaced in its lower region likewise in the direction of the seat cushion 11.

As a result of the guidance of the backrest 2 in the slideways 23, the height and

angle of the backrest 2 are altered by the adjustment of the seat cushion 11. The

seat occupant can thus freely choose and/or adjust his seating position between a

rather upright seating position and a rather angled rest position.

[0024]By means of a locking mechanism 3, represented in greater detail in

Figures 2 to 5, the backrest 2 is detachably connected to the vehicle-fixed sliding

block guide 22. The locking mechanism is disposed approximately halfway up the

backrest 2 and is symmetrical in structure. It comprises a transverse tube 31

and two bolts 34, engaging in the slideways 23 disposed to the left and right of

the backrest 2, as well as a centrally running draw band 33, connected to the

bolts 34 by levers 32.

[0025]The transverse tube 31 runs transversely to the backrest 2 and is

connected fixedly to the backrest frame 21. It supports the two bolts 34 in an

axially displaceable manner in a long hole, the bolts 34 being displaceable

beyond the open ends of the transverse tube 31. The backrest frame 21 has two

side members joined together at their one front face, so that the cross section of

the backrest frame is of approximate U-shaped configuration. In the space

between the two side members of the backrest frame 21, the sliding block guide

22 engages on both sides of the backrest at the level of the transverse tube 31.

The inner side member of the backrest frame 21 is connected to the transverse

tube 31 and has an opening through which the bolt 34 can reach. Disposed in

alignment with this opening is the opening in the slideway 23 and an opening in

the second side member of the backrest frame 21.

[0026] As represented in Figure 3 or Figure 4, if the locking mechanism 3

is locked, the bolt 34 disposed on both sides of the backrest 2 reaches through the

slideway 23 and back-grips the opening in the outer side member of the backrest

frame 21. The locking mechanism 3 in this way secures the backrest 2 firmly in

the vehicle. If the locking mechanism 3 is unlocked, the bolts 34, as represented

in Figure 2, are fully withdrawn into the transverse tube 31 and are disengaged

from the slideways 23, so that the backrest 2 is easily removable from the

vehicle.

[0027] The two levers 32 are rotatably connected at their one end to a

respective bolt 34. At their other end, the levers 32 are joined rotatably together

and connected to the draw band 33. The draw band runs along behind the vehicle

seat 1 and is accessible on the top side of the backrest 2 from above and on the

seat cushion 11 from below. It can be operated manually. For locking purposes,

the draw band 33 can be drawn downward, whereby the bolts 34 are displaced

outward by means of the levers 32. A stop 35 herein limits the downward travel

of the draw band 33 and is arranged such that, in the locked setting, the levers

32, beyond the mid-position of precisely 180°, stand at a shallow angle to each

other. Any play in the locking mechanism 3 is thereby compensated and a stable

locking position obtained. In the unlocking process, the draw band 33 is drawn

upward. By means of the levers 32, the bolts 34 are displaced inward and release

the backrest 2.

[0028]Over the path of the draw band 33, the locking of the backrest 2 is

able to be checked. If the backrest is correctly positioned, then the draw band 33

is drawn downward from the setting shown in Figure 2 into the setting shown in

Figures 3 and 4. If the backrest 2, for example, is not correctly positioned or if

one of the openings cannot be passed through freely, then the levers 32 cannot be

operated into the locking end position. The path covered by the draw band is

thus smaller. As represented in Figure 6 or Figure 7, the draw band 33 has a

shackle 36, which is disposed on the draw band at such a measurement-defined

location that it can be hung in a pin 37 disposed on the seat frame 21 only if the

backrest 2 is correctly locked. In cooperation with the pin 37, this marking in the

form of the shackle 36 allows the correct locking of the backrest 2 to be checked,

in spite of the locking mechanism 3 not being visible.

[0029]In order to prevent the locking mechanism 3 from being accidentally

opened, the draw band 33, on the pin 37, is protected from slipping off. As shown

in Figure 7, the pin 37 has a check nut 38, which prevents accidental release of

the draw band 33. After the draw band 33 has been hung, the check nut 38 is

screwed onto the pin 37, so that the draw band 33 cannot detach accidentally from the pin 37.
